

A Lung FACS · within-type detection

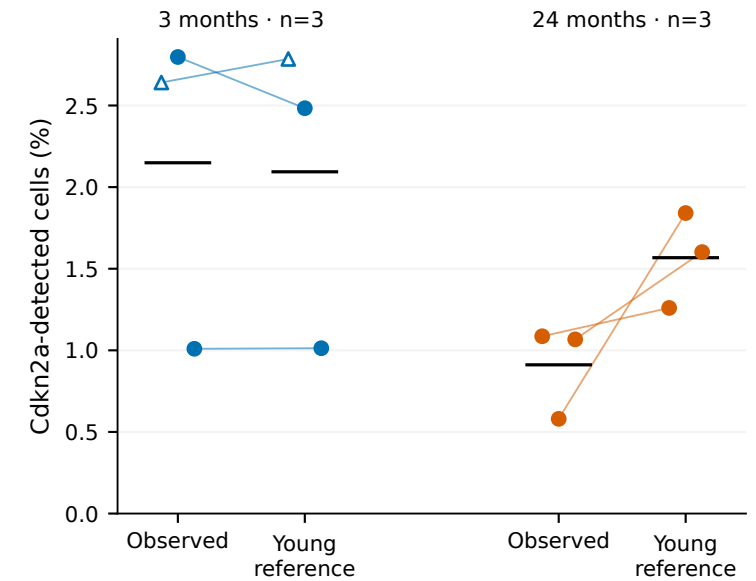

B Bladder droplet · within-type detection

C Lung · Cdkn2a detection

D Bladder · Cdkn2a detection

Within-type profiles locate age-associated RNA differences; fixed young composition asks whether population redistribution accounts for the tissue summary. A/B: 24 minus 3 months. C/D: connected values from each mouse; black bars, means; triangles, females. Sparse types and finer subtype mixtures remain unresolved. RNA detection does not establish senescence.
